JANE API description
Version 0.1
Author: Martijn Schuemie

URL parameters
The JANE web application can be accessed with parameters in the URL.

Start page URL parameters
- structured: Start page with structured query box. Example:
- text: Prepopulate the text field. Example:
  http://jane.biosemantics.org/index.php?text=This is a test

Suggestions page URL parameters
- findJournals: Returns suggestions for journals
- findAuthors: Returns suggestions for authors
- findPapers: Returns suggestions for papers
- structured: Treat text as structured query
- text: Input text

Examples:
http://jane.biosemantics.org/suggestions.php?findPapers&structured=text=malaria AND vaccine

Web service API
JANE can also be accessed as a SOAP web service. The WSDL can be found at:

The most important methods are:
- Journal[] getJournals(String text, String filterString)
  - text: the input text
  - filterString: a string specifying filters for the search. Best to leave empty
- Author[] getAuthors(String text, String filterString)
Each of these methods returns an array of objects. See the WSDL for details on the structure of these objects.
